1.0 Introduction

This report has been prepared by AECOM Environment (AECOM) on behalf of Consolidated Edison Company of New York, Inc. (Con Ed) to present the results of the indoor air sampling at building locations in the Peter Cooper Village property located in New York, New York.

The monitoring activities were conducted in accordance with the Interim Site Management Plan (ISMP) for Indoor Air Sampling (AECOM, 2009). The work plan was prepared as part of an ISMP to provide for environmental management at the site until a final remedy is selected and implemented. One requirement of the ISMP is to conduct annual indoor air monitoring to confirm that indoor air has not been impacted by Manufactured Gas Plant (MGP) residuals identified on the site. The methods and results from previous indoor air sampling have been reviewed by the New York State Department of Environmental Conservation (NYSDEC) and the New York State Department of Health (NYSDOH) and they have determined that indoor air in the buildings has not been impacted by the MGP residuals.

The Peter Cooper property includes multiple apartment buildings (Buildings 1 through 21), some of which overlay the footprint of the East 21st Street Works former MGP. As detailed in the ISMP, samples were collected at locations in each of the buildings. The purpose of this report is to describe the monitoring activities, present and document the results from the sampling, and interpret their meaning. The remainder of this report is organized as follows:

- Section 2 describes monitoring activities, including the sampling locations and procedures.
- Section 3 presents the analytical laboratory results and their interpretation.
- Section 4 summarizes the findings and provides recommendations.
- Section 5 lists the references cited in this report.
- Appendices provide documentation of results and data quality information.

2.0 Sampling Activities

This section describes the activities undertaken to collect data and information for the purposes of this evaluation. The following discussion identifies the sampling locations and summarizes the activities associated with a preliminary site inspection and the collection of indoor air samples.

2.1 Sampling Locations

The sampling locations were consistent with those used in the 2012 sampling event. The sampling locations are illustrated on Figure 1.

2.2 Site Inspection

A site walk was held with AECOM and Peter Cooper Village/Stuyvesant Town Property Engineering Department staff on March 4, 2014 to review the sampling locations and ensure that, when in place, sampling equipment would not interfere with the progress of residents, maintenance staff walking through the buildings and subcontractors working in the building basements to repair damages caused by Superstorm Sandy on October 29, 2012.

NYSDOH survey questionnaire forms were completed for each location and are presented in Appendix A. Data included observations of the heating, ventilation, and air conditioning (HVAC) system, odors, and potential hydrocarbon sources. The inspection revealed that the HVAC systems of the buildings are a steam/ hot air circulation design. Apartments have individually installed air conditioning window units. The basements have windows that surround the footprint of the building at ground level and vents that appear to remain open year-round.

2.3 Indoor and Ambient Air Sampling

Sampling was conducted by AECOM field staff on March 10th, 11th, 12th, and 14th, 2014. A screening evaluation was conducted at each location to refine the actual positioning of the sampling point. A photoionization detector (PID) measuring in parts per billion (ppb) was used to evaluate levels of volatile organic constituents (VOC). A Dräger Chip Measurement System (CMS) was used to measure benzene at a range from 0.2-10 parts per million (ppm). Benzene was not detected at any of the sampling locations all results were <0.2ppm using the Dräger CMS. The results from the screening analysis are included on the field sampling forms presented in Appendix A. Documentation of weather conditions, wind speed, and wind direction are also provided on the forms.

A total of 60 indoor air samples and 8 ambient air samples were collected using laboratory certified, six-liter volume Summa canisters. The canisters were equipped with flow regulators to collect integrated samples over an 8-hour period at each location. A list of the locations and samples are provided in Table 1. Photographs of each location are provided in Appendix B.

The samples were submitted to Test America Laboratory via courier and received at the end of each day for analysis. The samples were analyzed for VOCs by United States Environmental Protection Agency (USEPA) Method TO-15 and the Con Ed MGP list of analytes. Four field duplicate samples were collected/analyzed for quality assurance/quality control.

3.0 Presentation of Results

This section presents summaries of the laboratory results for analyses performed on ambient and indoor air samples collected at the site during the sampling events in February 2012.

3.1 Site Observations

Conditions that included the presence of cigarette smoke, cleaning, chemical storage, maintenance work on steam lines within the buildings, maintenance equipment storage, and paint storage were noted during sampling and are documented on the field sample forms in Appendix A. Pertinent observations at specific sampling locations are noted in the following section.

3.2 Summary of Results

Volatile organic compounds were detected in all of the indoor air and ambient air samples at concentrations ranging from approximately 0.10J µg/m3 to 880 µg/m3. Copies of the analytical laboratory reports are provided in Appendix C.

The VOC concentrations in indoor air samples were evaluated to determine whether the constituent concentrations were consistent with "background" levels derived from National (USEPA) and New York State analyses of air samples from within typical (non-contaminated) residences [NYSDOH, 2003, EPA, 1992]. Discussions of the results for MGP-related and non-MGP-related constituents are provided below.

Table 2 provides a summary of results for those locations where one or more volatile organic constituents were detected. Constituent exceedances of the established background levels (90th percentile) were limited to the following locations:

A comparison of these results with the 2012 data indicates that background levels were generally similar with distribution through a larger number of buildings, potentially due to maintenance/painting, etc. This is particularly true for 4-methyl-2-pentanone, or MIBK, which is a common solvent used for thinning lacquers and resins.

3.3 Quality Control

To meet the data quality objectives for this project, NYSDEC Analytical Service Protocols (ASP) were used with Category B deliverables [NYSDEC, 2000]. This analysis, which was completed by Test America, Inc. is currently listed with the New York State Department of Health Environmental Accreditation Program and has current Contract Laboratory Program (CLP) certification for all analyte categories. A Data Usability Study Report (DUSR) is provided in Appendix D.

4.0 Conclusions and Recommendations

The results demonstrate that indoor air concentrations of the principal VOCs associated with MGP residual, i.e. benzene and naphthalene are consistent with the background levels established by NYSDOH. Other compounds that can be associated with MGP residuals as well as paints and commercial cleaners, e.g ethylbenzene and xylenes,were present above background levels in 10 buildings. Several non-MGP constituents were detected at levels that were greater than established background levels in 16 of the buildings sampled, at a total of 27 locations (stairwells, trunk rooms, storage/bike rooms, and steam rooms) including 3 ambient locations. These compounds, chlorinated constituents and acetone are frequently associated with commercial cleaning products. The results of this sampling event were generally consistent with previous sampling conducted at the site in terms of the constituents detected and their concentrations.

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

All units in micrograms per cubic meter (µg/m³)

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

All units in micrograms per cubic meter (µg/m³)

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

All units in micrograms per cubic meter (µg/m³)

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

All units in micrograms per cubic meter (µg/m³)

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhause, construction materials, and cigarette smoke.

2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.

3 - New York State Department of Health, November 14, 2005.

Bold - Compound detected at a concentration greater than the method detection limit.

Exceeds NYSDOH Bakground Indoor Air Values 75th Percentile

Exceeds NYSDOH Bakground Indoor Air Values 90th Percentile

FD - As suffix on Sample ID indicates that the sample is a field duplicate.

NL - Not listed - data not available for background concentrations for these compounds.

U - The compound was analyzed for, but was not detected above the method detection limit.

J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

Receipt
The samples were received on 3/12/2014 8:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Except:

The following sample(s) was listed on the Chain of Custody (COC); however, no sample(s) was received: . PCV-IA3-B21, PCV-IA2-B19, PCV-IA1-B21, PCV-IA1-B19, PCV-IA3-B19, PCV-IA2-B21

Air - GC/MS VOA
Method(s) TO 14A, TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method(s) TO-15: There is a significant contribution from an interfering non-target analyte to the quantitation of propene in all samples. Therefore, the propene results are biased high and should be considered estimated. The result is flagged with “cn”.

Method(s) TO-15: Quantitation for the following analytes was previously based on a one-point calibration standard at the reporting limit.

2,3-Dimethylpentane
Ethanol
2,3-dihydroindene
Indene
Thiophene

These compounds were quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for these additional analytes is fully established:

• The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
• There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
• The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
• The LCS recovery criteria are set at 20% to 180%.
• A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Method(s) TO 15 LL, TO-15: Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

Method(s) TO 15 LL, TO-15: This report includes canister certification data for the batch certified and/or individually certified canisters used to collect samples as well as for any canisters used for dilution of those samples. All of the canisters used for sample collection or sample dilution for this job were certified to be clean to the levels listed on the results page. Please note that results for individually certified canisters that were not used for sample collection or sample dilution may also be included in the report because these canisters were in the same cleaning batch as the canisters used for this project. Since these canisters were not used for this job, the results have no bearing on the sample results.

No other analytical or quality issues were noted.

Receipt
The samples were received on 3/12/2014 9:59 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Except:

One or more containers for the following sample was received with the valve removed: PCV-IA2-B4 (140-1041-16). The sample could not be analyzed and was canceled.

Air - GC/MS VOA
Method(s) TO 14A, TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method(s) TO-15: The continuing calibration verification (CCV) associated with batch 958 exhibited % difference of > 30% for the following analyte(s) trichlorofluoromethane, however the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method(s) TO-15: Quantitation for the following analytes was previously based on a one-point calibration standard at the reporting limit.

2,3-Dimethylpentane
Ethanol
2,3-dihydroindene
Indene
Thiophene

These compounds were quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for these additional analytes is fully established:

• The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
• There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
• The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
• The LCS recovery criteria are set at 20% to 180%.
• A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Method(s) TO-15: There is a significant contribution from an interfering non-target analyte to the quantitation of propene in most of the samples. Therefore, the prppene results are biased high and should be considered estimated. The result is flagged with “cn”.

Method(s) TO 15 LL, TO-15: Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

Method(s) TO 15 LL, TO-15: This report includes canister certification data for the batch certified and/or individually certified canisters used to collect samples as well as for any canisters used for dilution of those samples. All of the canisters used for sample collection or sample dilution for this job were certified to be clean to the levels listed on the results page. Please note that results for individually certified canisters that were not used for sample collection or sample dilution may also be included in the report because these canisters were in the same cleaning batch as the canisters used for this project. Since these canisters were not used for this job, the results have no bearing on the sample results.

Method(s) TO-15: Canister certification # 890 and 986 for tetrachloroethene are shown as above the reporting limit for a low-level analysis, however, the result is less than the reporting limit required for this project.

No other analytical or quality issues were noted.
